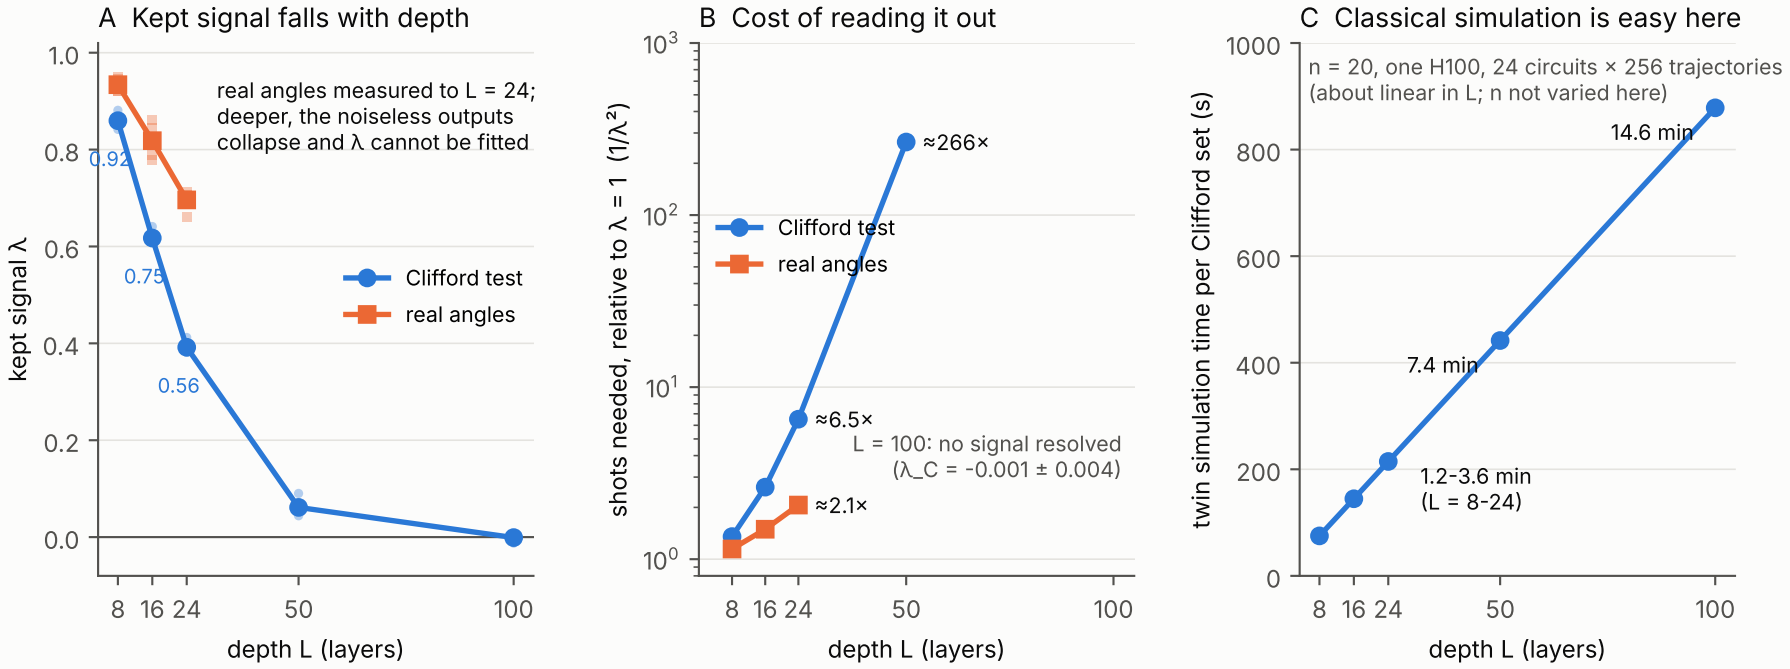
Flow L: n = 20 ring on one 20-qubit cycle, ibm_kingston 2026-10-24 day twin — model results, not a device



Points: four random classifiers (real angles; models 0-3) or four seeds of 24 random Clifford circuits; lines: their mean; numbers in A: ratio λ_C / λ. Real-angle L = 16 from flow J (model 0 re-run equal); L = 24 under amendment 1. Clifford test: noiseless value exactly ±1 by construction; circuits are drawn anew per L. It lies below the real-angle λ at L = 8-24, by a ratio that falls with depth (0.92, 0.75, 0.56).
